METHOD FOR DISPLAYING INFORMATION OF UPDATING BIOS

ABSTRACT OF THE DISCLOSURE

The purpose of the present invention is to provide a method for displaying an information of updating a basic input output system (BIOS) of a computer system, wherein the computer system having a specific configuration is initialized by a computer program stored in a basic input output system (BIOS) memory. The method includes steps of (a) interrupting the computer program in response to a first triggered signal, (b) loading an indexing data, (c) obtaining at least a file information of a basic input output system (BIOS) file and at least a directory information of a directory via an algorithm operation mathematical calculus according to the indexing data, (d) displaying the at least a file information and the at least a directory information, (e) selecting a demanded basic input output system (BIOS) file from the at least a file information and the at least a directory information, and (f) reprogramming the demanded basic input output system (BIOS) file into the basic input output system (BIOS) memory by means of executing a burn-in program.
